

How to read the labels: **VERIFIED** multi-source, adversarially fact-checked · **SINGLE SOURCE** one reputable source · **REASONING** derived from verified numbers · **YOUR DATA** your own match history (op.gg, position fields, July 2026). Stats are lolalytics patch 26.13, Emerald+ unless marked. Requested by Campbell (soup minion#NA1). This is the long one on purpose — it assumes nothing about jungle and explains everything once. The companion PDF covers Brand's other roles.

1 • The Honest Snapshot

VERIFIED Straight truth first, because a guide that hides it would be lying to you: **Brand jungle is an off-meta pick** on 26.13. Only ~1 in 20 Brand games at Emerald+ (and ~1 in 30 at Silver) are jungle — most Brands are supports — and his jungle win rate sits below 49% at every tier, bottom-10 of ~80 junglers. Riot also nerfed his early game *this exact patch* (§3). None of that makes him unplayable — it means he's a "because it's fun and I'm good at Brand" pick, not a free-ladder-points pick.

Cut (26.13)	Win rate	Pick rate	Games (n)	Rank among junglers
Emerald+	48.62%	0.31%	7,696	75 of 77
Gold	48.65%	0.36%	8,242	77 of 80
Silver	47.59%	0.30%	5,352	74 of 81
All ranks	47.95%	0.32%	31,954	77 of 80

YOUR DATA You, specifically (op.gg match payloads, July 6): Bronze 3 in both queues, and **Brand is already your best champion — 8 games, 6-2 this season**, and you've played him in *all five positions*, including a Brand-jungle **win today** (3/7/21 in a 41-minute flex game). Two things jump out of that jungle game. First, the good: 21 assists means you already play Brand's real teamfight job. Second, the fixable: **164 jungle CS in 41.6 minutes is 3.9 camps-CS per minute — very slow clears**, and clears are most of a jungler's income. \$7 is built around fixing exactly that. One more habit to steal from your own support games: you bought 6 control wards there and **zero in every other role**. \$2e.

YOUR DATA Your squad context: soup minion (Naafiri) was in **all 15** of your recent flex games and Jasio (Nunu, one-tricked) jungled in 10 of them — so Brand jungle is your slot for **solo queue and the nights Jasio isn't on**. Fair warning for those flex lobbies: premade MMR pulls them to Silver-Plat 4, well above your solo bracket.

VERIFIED One more honest note: your best *statistical* Brand roles are support (his home role, 51.9% at Emerald+, A-tier at Gold) and bot APC (his highest WR anywhere, ~53.8%). Those live in the companion PDF — this one is jungle because that's what you asked for.

REASONING What Brand jungle actually is: an **AoE burn machine** whose passive does percent-max-HP damage — camps and dragons don't get smaller to him as the game goes on, and his multi-camp AoE (W + spreading E) eats grouped camps and the Void Grub trio. What he is **not**: mobile. He has no dash, no escape, and every good early duelist in the game knows it (\$10 and \$11 deal with that). Game plan in one line: **clear fast, gank with the stun, own every grouped objective, and teamfight like the support Brand you already are — from 900 range, not the front line**.

2 · Jungle 101 — the rules nobody explains

You've jungled a handful of games (Graves x2, Brand today). This section is the stuff the game never tells you, verified against the wiki's current pages — several popular guide sites still show pre-2026 numbers.

2a · Smite

VERIFIED Smite deals **600 true damage** to a monster. You get your first charge at **0:48**, it recharges every 90s, holds max 2 charges, and has a 15s cooldown between casts. Feeding your jungle pet **treats** (earned by killing large monsters) upgrades it: at **15 treats → Unleashed Smite (1,000)**, at **35 treats → Primal Smite (1,400)**, hits nearby monsters too, consumes the pet item and frees the slot, and unlocks your pet's bonus passive). Both upgraded tiers also let you Smite *champions and their pets* for 40 true damage + a 20% slow for 2s. Two rules that decide games: **never start Dragon/Baron/Grubs without a Smite charge up**, and at any contested objective, save Smite for the execute — the enemy jungler's Smite vs yours is a duel over the objective's last 600-1,400 HP, and the higher Smite tier wins the raw race.

2b · Your pet

VERIFIED Junglers start with a 450g pet that makes camps damage you less and die faster — buying one (plus a Health Potion) IS the jungle start; it also gates treat progress. Brand's pick: **Scorchclaw Pup** (71% of Brand jungle games). **SINGLE SOURCE** Fully stacked (large monster kills fill it), your next hit on a champion burns them for 5% max-HP true damage and slows 30% — a free gank-stick that stacks with everything in \$8. **VERIFIED** Curiosity for later: Mosstomper (the shield pet) posts 53.3% WR at Emerald+ on n=289 — a real "immobile mage needs padding" signal, but the sample is thin; Scorchclaw is the default.

2c · Camp timers — 2026 numbers (many sites still show the old ones)

Camp	First spawn	Respawn (from its death)
Red / Blue buff	0:55	5:00
Wolves, Raptors	0:55	2:15
Gromp, Krugs	1:07	2:15
Scuttle crab (river)	2:55	2:30

VERIFIED Patch 26.01 moved all of these up (~35s earlier than every pre-2026 guide). The respawn clock runs from the moment the camp *dies* — so the rhythm of jungling is: clear a side, spend ~30–60s ganking/warding/backing, and be back as camps repop. Standing in your jungle waiting for a camp is wasted time; walking past an up camp without killing it is wasted gold.

2d · The objective clock

Objective	Timing	Why you care
Void Grubs (trio, top river)	8:00 → despawn 14:45 · one spawn per game	Each grub eaten = your whole team's attacks burn structures. Three camps standing in a cluster — Brand's best objective in the game (\$9).
Dragon (bot river)	5:00, respawns 5:00 after	Permanent team stat buffs; 4th drake = Soul. The bot-side mirror of grubs.
Rift Herald (top river)	15:00 → despawns 19:45	Take it, drop the Eye, ram a tower. Once per game.
Baron	20:00	The game-ender. Never start it without Smite up; assume the enemy jungler is 3 seconds away.

2e · Four habits that are the actual rank-up

- **YOUR DATA** **Buy control wards.** You bought 6 across two support games and zero anywhere else. As a jungler, one pink at 75g in the river bush or an objective pit pays for itself the first time it catches a contest coming. Rule: **one control ward on every back after the first.**
- **VERIFIED** **Track the enemy jungler with TAB.** Every camp is worth 4 CS. If the enemy jungler shows at scuttle with 12 CS, they did a 3-camp path; ~24 CS means a full clear. Their CS tells you where they started, so it tells you where they'll gank next.
- **VERIFIED** **Falling behind isn't fatal.** Jungle catch-up XP scales up when you're behind — a deficit shrinks fast if you just keep farming. What actually loses games is dying trying to fix it instantly (\$10).
- **REASONING** **Back on purpose.** Recall when you can afford a real item step (\$6b), when you're too low to fight over the next objective, or ~45s before Dragon/Grubs spawns so you arrive full HP with Smite. Never back at 30% HP "to keep farming" into an invade-happy jungler.

3 · The Kit — a jungler's reading

Ability	What it actually does
 P · Blaze	VERIFIED Every ability hit sets the target Ablaze: 2% of their max HP burned over 4s per stack, max 3 stacks (ticks every 0.25s). At 3 stacks on a champion or large monster, it detonates after 2s: 6-12% (by level) +2% per 100 AP of max HP to everything in a 475 radius. Kills with abilities (or of any burning target) refund 20-40 mana — your sustain. This passive is why Brand never falls off vs dragons and tanks: percent-HP doesn't care how big they are.
 Q · Sear	VERIFIED Skillshot, range 1100 (edge 1040): 70-190 (+65% AP). The headline: if the target is already burning, Q stuns for 1.75s . Not burning = no stun. Every gank you ever land is "apply fire first, then Q." CD 8→6s, 70 mana.
 W · Pillar of Flame	VERIFIED 900-range AoE circle (260 radius): 75-255 (+70% AP), and +25% vs targets already Ablaze . It lands 0.627s after cast (0.891s including cast time) — lead moving targets, or stun them first. Your max-first skill and your whole camp clear.
 E · Conflagration	VERIFIED Point-and-click (never misses), range 675: 55-155 (+60% AP), and it spreads — a small 300-unit blast on a fresh target, doubled to 600 if the target is already Ablaze , which is the version that actually covers a camp or a teamfight: light them first, then E . Spread targets are locked at cast; the fire homes in even if they run. 26.13 raised its mana to 90 flat — respect it early (§7). CD 13→9s.
 R · Pyroclasm	VERIFIED A fireball that hits for 100/175/250 (+30% AP) and then bounces up to 4 times between nearby enemies (and Brand himself), 600 search radius, preferring burning champions → other champions → anything else . Against one isolated enemy it hits them up to 3 times (300/525/750 +90% AP total). Burning targets hit by it are also slowed 30/45/60%. CD 100/90/80, range 750. Full usage rules in §4 — this button has real discipline attached.

Blaze vs monsters — your clear engine, and what 26.13 did to it

VERIFIED Vs monsters, Blaze ticks do **270% damage**, capped per tick at 12.5/25/37.5 (1/2/3 stacks) vs regular camps and 20/40/60 vs epics — that's up to **150 damage per second vs camps and 240/s vs Dragon and Baron**, before any of your actual spells. The 3-stack detonation is capped at 270-525 (by level) vs monsters.

VERIFIED The 26.13 nerf: the detonation floor dropped from 8% to **6% max HP**. The monster cap doesn't protect your clear from this — at 6%, the cap only kicks in above 4,500 max HP, and camps spawn far below that (**Gromp 2,050, Blue buff 2,300**; Blue only reaches its 6,210 max late game). So early detonations are uncapped percent damage, and this patch made them smaller. Translation: your first clear got slightly slower *this patch*, so route hygiene (§7) matters more, not less. Same patch also gave back mana regen (9→11) and made E cost 90 flat.

4 • Combos — four buttons, strict order

Combo	Buttons	When & why
Camp clear loop	W → E → Q → W on CD	W first — set the whole camp on fire. E wants a burning target: off one, its spread doubles and reliably tags everything. Then Q the big monster — the Ablaze stun works on camps and scuttle too (only epics like Dragon and Baron are CC-immune), and it stacks toward the detonation , the real clear speedup — and every W after the first hits the burning pile for +25% . Details per camp in §7.
The gank string	E → Q(stun) → W → autos	E is point-and-click — guaranteed fire — so the follow-up Q is a 1.75s stun on a much easier target. W lands inside the stun window. This is 90% of your ganks.
Long-range opener	W → Q → E	From fog, 900 range, before they know you're there. Harder (W must hit a moving target) but starts the fight from further than most junglers can answer. If W misses, just leave.
Full burst (post-6)	E → Q → W → R	Three stacks + detonation + R raining down, with R's bounces preferring the burning target. Kills most squishies from level 11 on.
Teamfight	W clump → E a burning one → R → Q	W lights several at once, E off a burning target spreads at double range, then R the burning clump — bounces prefer burning champions, so pre-spreading turns R into a 5-hit detonation chain. Q whoever tries to leave: they're all stun-ready.

VERIFIED **R discipline — read twice:** (1) It's a **2+ enemies button** in fights; near minions or camps the bounces bleed into them (anything is a valid bounce target after champions — including Brand himself). (2) If the **first** target spell-shields (Sivir, Morgana Black Shield, Banshee's), the *entire spell fizzles — zero bounces*. A shield on a later bounce only eats that one hit and the chain continues. So never open R into a visible spell shield; strip it with E first. (3) Bounce count: **4, confirmed on the in-client tooltip** — the shop-data text saying 5 is stale.

5 • Runes & Summoners

YOUR DATA Good news: **you already run the correct page.** All 8 of your Brand games this season used Deathfire Touch with Precision secondary — that's the statistically best setup at every tier, and most Bronze players are NOT on the right page. Below is the exact best version of what you're already doing.

Piece	Choice	Notes
Keystone	 Deathfire Touch (Sorcery)	VERIFIED 73% pick, and it beats Dark Harvest at every tier — by ~3pp at Gold, narrowing to roughly even at Bronze. Your spell damage sticks a burn (magic damage, scaling with AP) — on a champion whose whole kit is already burns. Re-added to the game in 26.09.
Sorcery row	Manaflow Band · Transcendence · Scorch	VERIFIED The most-picked page at every tier (48–49.6% depending on tier). One directional upgrade if you want to experiment: Gathering Storm over Scorch — it out-wins Scorch at every tier checked, including Silver and Bronze. (Waterwalking looks good in the Emerald+ numbers but loses to Scorch at low elo — skip it.)
Secondary	Precision: Cut Down + Presence of Mind	VERIFIED Cut Down = "8% more damage to champions above 60% max health" — your burns start every fight vs full-HP targets, so it's basically always on at the moment you engage.
Shards	Ability Haste / Adaptive / Health	VERIFIED One real upgrade over the most-picked page: Ability Haste in the first (offense) shard slot wins by ~2.5pp over the default double-Adaptive (50.1% vs 47.6%, n≈2.3k). More casts = more Blaze stacks. (Haste only exists in the offense slot — the flex slot offers Adaptive/Move Speed/Health.)
Summoners & start	Flash + Smite ·  Scorchclaw + Health Potion	VERIFIED Flash+Smite is 95.8% of games. No Flash = no escape on a champion with no dash; non-negotiable.

VERIFIED **Deathfire Touch fine print** (it matters for Brand): the burn lasts **4s only from single-target spell damage — for Brand, just Q**. Area damage (your W, E and R) applies a **2s** burn, and damage-over-time ticks (Blaze itself) refresh only a **1s** burn. It's still his best keystone — it just means Q into a fleeing target is your longest-bleeding poke, and DFT is really a "many refreshes" rune on Brand, not a "one big burn" rune.

6 • Build

6a • The core three

Order	Item	Why
1st	 Liandry's Torment 3000g	VERIFIED 60 AP, 300 HP; your ability damage adds a burn of 1% of max HP per 0.5s for 3s , plus up to +6% damage amp the longer you fight. Percent-HP burn on the percent-HP burn champion. Most picked first at every tier and the safest: at Silver, Liandry's-first wins 49.8% vs Blackfire-first 45.2% .
2nd	 Sorcerer's Shoes 1100g	VERIFIED 76% pick; magic pen is his best cheap damage. Note for 2026: the free tier-3 upgrade (SpellSlinger's Shoes) is a midlane role-quest reward — junglers don't get it ; your role progression is the pet-treats track (\$2a). Plan around plain Sorcs.
3rd	 Rylai's Crystal Scepter 2600g	VERIFIED 65 AP, 400 HP, and ability damage slows 30% for 1s — every Blaze tick re-applies it , so anything you set on fire is slowed for the whole burn +1s. On a dash-less ganker this is the item that makes ganks stick. Liandry's and Rylai's are his two most-bought legends at every tier, and the full core below is the proven line.

VERIFIED The full core (Liandry's → Sorcs → Rylai's) is the most-played line at 51.6% WR (n=1,493) — above Brand jungle's 48.6% average. Fine print on the slow: Rylai's is triggered by *ability* damage — Blaze counts, but

Liandry's and Blackfire's own item burns don't (they're tagged as non-spell damage), so the perma-slow comes from keeping YOUR fire refreshed, not from items ticking.

YOUR DATA

About your Blackfire Torch habit — you built it in 7 of 8 Brand games. It's not wrong: Blackfire is a real Brand item (each burning champion or large monster = +4% AP for you, lovely in jungle), it's fully legal alongside Liandry's, and at Emerald+ the Blackfire→Liandry's line actually posts the best numbers. But **at Silver/Bronze it measurably underperforms** (45.2% first-item vs Liandry's 49.8%) — most likely because it's a tempo item that rewards perfect early aggression, while Liandry's+Rylai's forgives mistakes. Recommendation: **Liandry's first every game for now**; if you want your torch back, slot Blackfire third instead of Rylai's only when you're already fed and the enemy has no divers.

6b · First back — what to buy with what you have

REASONING (component prices DDragon-verified) You'll rarely back with exactly 3000g. The ladder toward Liandry's:

- **~900g:**  **Fated Ashes** — 30 AP and its own mini-burn that does **+45 bonus damage vs monsters**. The single best early jungle buy on him.
- **~1300g:** add  **Haunting Guise** (30 AP, 200 HP, ramping damage amp) — Fated Ashes + Haunting Guise + 800g = Liandry's.
- **350g spare:** **Dark Seal** if you're snowballing and confident; a **Control Ward** always (\$2e).
- **Boots 300g** early if their jungler is a skirmisher you need to sidestep.

6c · Items 4-6 — the situational half

Item	The job
 Zhonya's Hourglass 3250g	VERIFIED The best 3rd/4th item in the data by a mile (54.3% at slot 3, 61.7% at slot 4). You're an immobile mage who wants to stand in mid-fight range: the 2.5s stasis IS your missing escape. Buy it 3rd every time they have assassins or dive (Zed, Kha'Zix, Vi, Nocturne...). Your burns keep ticking while you're golden.
 Shadowflame 3200g	VERIFIED 110 AP, 15 magic pen, and your magic damage crits for 120% vs enemies below 40% HP — including every Blaze and Liandry's tick . The finisher item: burns start executing people. Great 3rd/4th vs squishy comps.
 Bloodletter's Curse 2900g	VERIFIED (group) Stacking magic-resist shred as you damage them — your DoTs stack it hands-free, and it shreds for your whole AP team. Vs tanky-MR comps. Shop rule: Limited to 1 Blight item — it shares a group with Void Staff (and Cryptbloom); you can never own two of those.
 Void Staff 3000g	VERIFIED 40% magic pen; the raw math answer once two enemies stack MR. Same Blight group as above — pick <i>one</i> shred item.
 Morellonomicon 2850g	VERIFIED Anti-heal: your magic damage applies 40% Grievous Wounds (that's the max — the old 60% tier doesn't exist). Buy vs Soraka/Mundo/lifesteal stackers; one Grievous buyer per team is enough , and your DoTs keep it applied constantly, so that buyer should be you.
 Rabadon's Deathcap 3500g	VERIFIED +30% total AP; the "I'm fed, end the game" 5th item.
Malignance — don't	VERIFIED Looks Brand-flavored (ult haste + R burn zone) but posts ~39% WR as a first item at Gold/Silver. A trap on jungle Brand; his R is already low-CD.

6d · Reading the enemy comp (the 30-second lobby audit)

If the enemy team has...	You prioritize
2+ tanks / 3k-HP frontline	REASONING Nothing changes — this is Brand's favorite lobby. Blaze + Liandry's are percent-HP; add Void Staff or Bloodletter's (never both) 4th. Keep Cut Down.
Assassins / hard dive (Zed, Kha'Zix, Vi, Noc)	REASONING Zhonya's third , before Rylai's if it's bad. Consider Mercs/Steelcaps over Sorcs if they also have heavy CC. Play behind your frontline at W range.
All-squishy poke comp	REASONING Shadowflame climbs to 3rd; consider swapping Cut Down → Coup de Grace (the below-40% twin) since nobody stays above 60% long.
Big healing (Soraka, Aatrox, Vlad)	REASONING Morello 4th — you're the team's best Grievous applicator.
A spell-shield user (Sivir, Morgana, Banshee's buyer)	REASONING Doesn't change the build — changes the R rule : E strips the shield first, or R a different primary target (\$4).

7 · Skills & the First Clear — fixing the 3.9

VERIFIED Skill max: **W > Q > E**, R at 6/11/16 (68% pick, and the winning order at every tier). Level 1: take **W** — it's what low-elo Brands overwhelmingly do (69–74% at Gold/Silver) and it fits the AoE-clear logic below. Level 2 take Q, level 3 take E. **REASONING** (Emerald+ actually splits W/Q at level 1 close to 50/50 — if you ever start buff-side and want max single-target damage on Red, Q-first works; W-first is the simpler default and this guide assumes it.)

The route (red side start; mirror it from blue)

1. **Red buff (0:55)** — W as it spawns, autos, W again on cooldown, Smite it low (you only have W at level 1 — Q isn't on your bar yet). Kite it: Brand outranges every camp, so **cast from max range and step back between casts** — damage you don't take is HP you gank with. It dies, you hit level 2: put the point in Q on the walk.
2. **Krugs (1:07)** — W the pair, Q the big one on cooldown.
3. **Raptors** — the AoE showcase: **W the clump** (the whole camp catches fire) → **E the big raptor** — off a burning target the spread doubles and hits everything → Q the big one, W again for +25% on the burning pile. Level 3 here.
4. **Wolves** — same W→E→Q loop.
5. **Blue buff** — single target: W, Q, E, W. Your mana comes back on kills (passive refund) + Blue itself.
6. **Gromp** — W, Q, E; Smite if it's slow. Level 4: second point in W.
7. **Scuttle (2:55)** — arrive ~2:50. If the enemy jungler contests, remember §10; you are not a level-3 duelist.

REASONING Why W leads everywhere: it's your one guaranteed way to set a whole camp Ablaze at once, and everything downstream wants the fire already burning — E's spread doubles (300→600) off a burning target, which is what actually covers a camp, and every W after the first hits burning targets for +25%. On single targets (buffs, Gromp) there's nothing to spread to; it's just W→Q→E on cooldown. Either way, cycle everything — **3 Blaze stacks on the big monster = a detonation**, which is a huge chunk of the camp's HP bar.

VERIFIED Two pace anchors are solid: the recorded **Brand full-clear world record for 2026 is 2:34** — an optimized ceiling, not a goal, but proof Brand is one of the fast AoE clearers — and scuttle spawns at 2:55. **REASONING** The pace rule built on those anchors: **a full clear should have you making your river decision at scuttle spawn or shortly after** — in practice, all six camps done by ~3:15–3:30 is a clean clear, and Brand's AoE makes sub-3:00 reachable with practice. Level 3 off the first three camps lands ~2:15–2:30 (also derived, not measured). **YOUR DATA** Your Brand game today averaged 3.9 jungle CS/min over the whole game — a full-clear rhythm is closer to 5.5+. The gap is almost always: waiting out full animations instead of kiting, walking between camps without a reason, and skipping repops. Two weeks of "clear on a timer" fixes it.

8 • Ganking — the stun is the gank

REASONING Brand ganks are binary: land the stun and someone usually dies; miss everything and you've spent 8 seconds and 250 mana waving at them. So gank where the stun is *guaranteed*: walk into **675 range and open with point-and-click E**, then Q the burning target — 1.75s is longer than most Flash reaction times at your elo. Only use the W-first long-range opener when they're CC'd by your laner or channeling/recalling.

- **VERIFIED** **Pre-6 you can gank from level 3**, but the community consensus is blunt: if Q doesn't land, the gank fails. Pick lanes where your laner has CC to layer with (their hook/root → your free E-Q).
- **REASONING** **Best lanes for you:** anyone with setup CC (your flex squad: Naafiri Q poke isn't setup, but a Blitz hook or Nunu snowball absolutely is). Worst: lanes hugging tower with no CC — you have no dive tool.
- **VERIFIED** **Post-6:** E → Q → W → R. R's slow only applies to burning targets, and with Rylai's online everything you touch is slowed anyway — post-Rylai's ganks (§6a) are your power spike as much as any level.
- **SINGLE SOURCE** Scorchclaw at full stacks adds a 5% max-HP true burn + 30% slow to your first hit — time ganks for when it's lit.

- **REASONING** **Counter-gank > gank** when their jungler shows on the map bot and your bot is pushing: arrive second, E-Q the diver, collect. Brand's AoE wins 3v3s that his 1v1 never could.

9 • Objectives — where Brand is secretly good

- **VERIFIED** **Void Grubs (8:00) are your best objective in the game.** Three clustered camps, and your E spreads + W blankets all of them while Blaze burns each for percent-HP (epic-monster tick cap is the higher 20/40/60 tier). Path top-side at 7:40 with Smite up, most games.
- **VERIFIED** **Dragons:** the 240 DPS burn ceiling at 3 stacks means you solo drakes faster than most mages. Keep 3 stacks rolling (any spell refreshes) and hold Smite for the kill — **600 / 1,000 / 1,400 HP depending on your Smite tier** (base / Unleashed / Primal); for most solo drakes that means ~1,000 with Unleashed.
- **REASONING** **Contested pits:** you are the best "fight in a doorway" champion at the objective — W + E spread into the choke as they file in, R once 3+ are burning. Fights at Dragon are where those 21 assists came from; keep doing that, from the back.
- **VERIFIED** Baron at 20:00: never start without Smite; drop your control ward in the pit bush first (\$2e).

10 • When You Get Invaded

REASONING Brand is exactly who early duelists look for: immobile, squishy, no escape. The counter-intuitive rule: **invades steal gold, but deaths donate games.** Your answers, in order:

1. **See it coming (free):** your leash-side laners ward river at 0:40 game one; you pink the pixel brush on your first back. If their jungler is a Kha'Zix/Viego/Lee type (\$11), assume the invade until proven otherwise.
2. **Don't take the duel.** Level 2-4, hand over the camp if they arrive first or in person. A camp is 4 CS; your Flash+death is their double buff and a plate.
3. **Mirror-farm instead.** They're in your Red-side? You're in their Red-side. Camps are identical gold; the map is symmetric. Take theirs, cross back, and let jungle catch-up XP (\$2e) erase the rest.
4. **Convert their overreach.** An invading jungler shows on the map far from their lanes — that's your window to E-Q gank the opposite side or start Grubs/Dragon solo. Trade up, not even.
5. **With the squad:** in flex nights, tell soup minion the invade is live — a mid roaming to a jungle 2v1 with your guaranteed E-Q stun is a kill more often than not.

11 • Matchups — jungle vs jungle

All-ranks, 26.13, minimum 300 games per cell; win rate is Brand's. "Matchup" for junglers means the whole early game — invades, scuttle fights, objective 1v1s — not a lane.

They beat you (worst 10)	You beat them (best 10)
Naafiri 39.9% · Kha'Zix 43.5% · Vi 45.3% · Shaco, Nocturne, Master Yi, Lillia (all ~45-46%) · Viego 46.2% · Shyvana & Ekko 46.3% (the tail of this list shuffles day to day — the archetype is what matters)	Locke 55.8%* · Hecarim 54.1% · Malphite 53.3% · Amumu 52.0% · Sejuani 51.7% · Warwick 51.1% · Lee Sin 51.1% · Jax 50.9% · Rammus 50.8% · Zac 50.7%

VERIFIED The pattern is one sentence: **Brand beats tanks and loses to AD assassins and dive.** Every bad matchup is someone who jumps on him; every good one is a big slow target that burns. *Locke released *this patch* (26.13) — that 55.8% is people not knowing the champ yet; don't trust it as a real counter. **YOUR DATA** And yes — Brand's single worst matchup in the entire game is **Naafiri**, the champion your duo plays. In your flex games she's always on YOUR side, so the worst matchup you literally cannot face there. In solo queue: if

Naafiri jungle appears in the enemy lobby, that's your cue to play the \$10 playbook from minute zero, or to have hovered a different pick.

REASONING Vs the bad list: full-clear away from them, pink your entrances, let them have scuttle, and scale to the 5v5 AoE fights they can't match. Vs the good list: you can actually contest scuttle and grubs — your percent-HP burn out-duels tanks even-level.

12 · What we couldn't verify (and how to close it)

- **Whether Q's stun consumes Blaze stacks** (i.e., does E→Q still reach detonation as fast): not stated anywhere authoritative. Minor — play as if it doesn't and watch the detonation ring.
- **Level-3 timing in §7** is derived from the 2026 spawn times; the full-clear targets are sourced (world-record video + 2026 pathing guides).
- The 4s per-target re-detonation cooldown on Blaze, and the exact ~14–15 min Smite-quest pace, are single-source details — treated as minor here.
- All win rates are lolalytics (one site), patch 26.13, pulled 2026-07-06; patch 26.14 lands ~July 8–9 and clears/detonation numbers above should be re-checked then.

Brand Jungle — built July 6, 2026 for send help#2366 at Campbell's request · Patch 26.13 / Data Dragon 16.13.1 · Sources: League Wiki (Brand, Smite, Void Grub, Rift Herald, jungle monster pages — mechanics authority), Riot Data Dragon (items, runes), lolalytics 26.13 (Emerald+/Gold/Silver/all-ranks cuts), op.gg (your match history, position-field verified), jungler.gg / Mobalytics / dodge.gg / tapin.gg / BoostRoom 2026 pathing (coaching heuristics, corrected against wiki where stale), 2026 Brand clear-record video (2:34), R bounce count confirmed in-client by Campbell 2026-07-06. Every stat re-verified by an independent fact-check pass; labels mark the confidence of each claim. Images © Riot Games via Data Dragon.
